

Release Notes: Version 5.0.294

Date: 21th October 2012.

Service pack release after main 5.0.284

Functionality:	Installer Improvement.
Tracking url:	Internal email
Comment:	During installation, the installer verifies the username/password supplied for IIS application pool and Windows service. When there is some exception in querying AD (ex: not-adequate permission), the installer won't allow user to get past the screen. This is now relaxed; the installer will allow the user to complete the installation.

Bug:	Throttling analyser. Unable to open help.
Tracking url:	Internal testing
Comment:	When throttling analyser graph legends are clicked, a pop up help window is supposed to open, instead an exception raised with "Object reference not set". Fixed in this version.

Bug:	Send port process monitoring.
Tracking url:	Internal testing
Comment:	Some of the fixes that's been done for receive location process monitoring were not replicated on send side. Now they are identical.

Bug:	Advanced Event Viewer date time issue.
Tracking url:	Customer Email
Comment:	Advanced event viewer data time column was displaying date in GMT instead of local date time. Fixed in this version.
